Fiesta Gas Delivery App — Initial Proposal

Oct 29, 2026 · @Dave Charm

Overview

We propose a delivery and customer-management platform for a local Fiesta Gas (Petron partner) LPG distributor in Pangasinan. Customers order refills the way they order food online, riders deliver with payment and proof captured on the spot, and the business uses each customer's refill cycle to send reminders and promos by SMS.

The problem today. Orders typically come in by call, text or Messenger and are tracked by hand. There is no map of where customers are, no record of how often each household reorders, and follow-ups depend on staff memory.

The concept. One system with four parts:

- **Customer map and directory** covering Pangasinan, searchable by name, town and barangay
- **Ordering and delivery** with rider assignment, payment collection, proof of delivery and cylinder inventory updated by each delivery
- **Analytics** on delivery speed and how fast each customer uses up a tank
- **Automated engagement**: refill reminders, a follow-up list for staff, and SMS text blasts for promos

Goals and success metrics

The platform succeeds if it makes deliveries faster, brings customers back sooner, and turns follow-up from guesswork into a daily list. Baselines and targets will be set during discovery using the distributor's current numbers.

Goal	How we measure it
Faster deliveries	Average minutes from order placed to delivered, per rider and per town
More repeat orders	Share of customers who place a second order; average days between refills

Goal	How we measure it
Fewer lost customers	Customers past their expected refill date who were contacted, and how many reordered
Better promo results	Orders placed within a set window after an SMS blast
Less manual work	Orders encoded by hand vs. placed by customers directly

Users and roles

Four roles use the system, each through the interface that fits how they work.

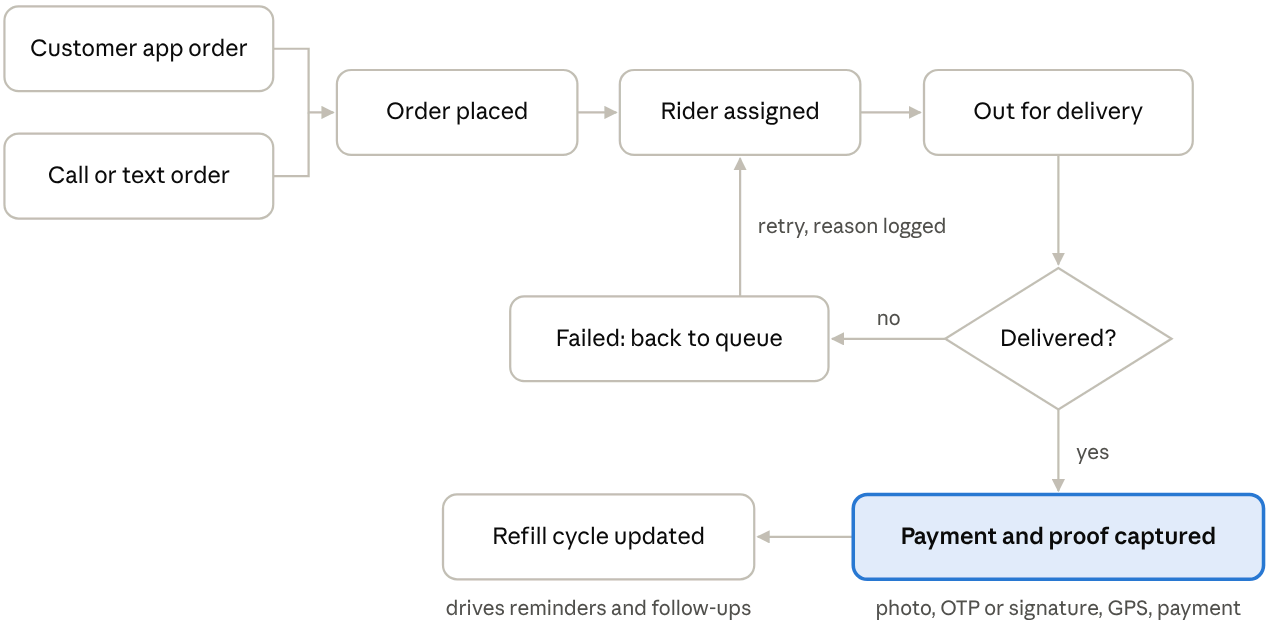

Role	Interface	Main jobs
Customer	Mobile web app (no install needed)	Place a refill order, pick cylinder size, choose payment, track the rider, view order history
Dispatcher / Admin	Web dashboard	Encode call and text orders, manage the customer map, assign riders, handle cancellations
Rider	Mobile app	See assigned deliveries and the route, collect payment, capture proof of delivery, log empties collected
Owner / Manager	Web dashboard	View analytics, manage products, prices and inventory, run text blasts, review rider remittances

Dispatcher-encoded orders stay a first-class path. Many LPG customers will keep calling or texting, and the system should capture those orders just as fully as app orders.

Core features

Every order, whether from the app or a phone call, follows the same path from placement to proof of delivery.

Every order, app or call, ends with payment and proof captured

order flow · 2 entry points, 1 retry loop

Call and text orders join the same flow as app orders. A failed delivery returns for reassignment with its reason logged, and every completed order updates the customer's refill cycle.

Customer mapping

- Each customer is a pin on a map of Pangasinan, saved with name, contact number, town, barangay, street or purok, and a landmark
- Pins can be dropped by the customer, by the rider on first delivery, or by the dispatcher
- Map view filters by town, barangay, cylinder size and last order date
- Barangay-level view shows where customers are concentrated and where coverage is thin

Search

- Search by customer name, mobile number, town or barangay
- Town and barangay use a standard Pangasinan list so records stay consistent, not free text
- Results open the customer profile: address, pin, order history, refill cycle and notes

Ordering

- Customer picks cylinder size, quantity and order type (refill swap or new tank with deposit)
- Dispatcher can encode orders for walk-in, call and text customers in a few clicks
- Customer gets order confirmation and status updates by SMS or in the app

Delivery and dispatch

- Dispatcher assigns orders to riders, or the system suggests the nearest available rider
- Order status moves through Placed, Assigned, Out for delivery, Delivered or Failed
- Rider app shows the delivery list, customer pin and directions
- Failed deliveries (no one home, wrong address) return to the queue with a reason

Payment

- Cash on delivery and e-wallets (GCash, Maya) recorded per order
- Online prepayment through a payment gateway (optional add-on)
- End-of-day rider remittance report: expected collections vs. cash turned over

Proof of delivery

- Photo of the delivered cylinder at the customer's location
- Customer signature or a one-time code sent to their phone
- GPS location and timestamp captured automatically
- Empty cylinder collected logged against the order

Inventory

- Stock of full and empty cylinders per size, updated automatically: delivered orders deduct full tanks, collected empties are added back
- Stock-in recorded when refilled cylinders arrive from the supplier
- Rider load-out at the start of the day and return count at the end, so every tank is accounted for
- Cylinders and deposits held by each customer, for new-tank sales and returns
- Low-stock alerts per cylinder size, and stock counts with adjustment reasons
- Inventory report: movements, current levels and discrepancies

Analytics and refill-cycle tracking

The key insight is each customer's refill cycle: the days between one order and the next tell us when they will need gas again. That date drives reminders and follow-ups.

How the refill cycle works

1. First order is recorded; until a second order arrives, the customer gets a default cycle based on their cylinder size and the area average.
2. Second order sets their first real cycle (days from first to second order). This first-to-second interval is tracked on its own, since it is the clearest sign of whether a new customer is sticking.
3. Each later order updates the customer's average cycle.
4. Expected next refill date = last order date + average cycle. Customers past that date by a set grace period are flagged as overdue.

Dashboard metrics

Metric	How it is computed	What it is for
Delivery time	Minutes from order placed to delivered	Rider performance, problem areas
Time to dispatch	Minutes from order placed to rider assigned	Dispatcher workload
Refill cycle	Average days between a customer's orders	Reminder timing, demand forecast
First-to-second order interval	Days between a customer's 1st and 2nd order	New-customer retention, follow-up basis
Due and overdue customers	Customers whose expected refill date is near or past	Daily follow-up list
Repeat rate	Share of customers with 2 or more orders	Loyalty
Sales by area	Orders and revenue by town and barangay	Coverage and promo targeting
Sales by product	Units by cylinder size	Stock planning
Failed deliveries	Count and reasons	Address quality, rider issues

Automated reminders, lead follow-up and text blasts

The refill cycle turns into action three ways: an automatic reminder before the customer runs out, a follow-up list for staff when they do not reorder, and segmented text blasts for promos.

Automatic refill reminder

- SMS sent a set number of days before the customer's expected refill date, with a reply-to-order keyword or a link to order
- Timing, message template and quiet hours are configurable by the owner
- Customers can opt out at any time

Lead follow-up

- Customers who pass their expected date without ordering appear on a daily follow-up list
- Staff log each call or message: reached, ordered, switched supplier, not interested, call back later
- Follow-up outcomes feed back into analytics, so the team can see which customers were saved and which were lost
- New prospects (referrals, walk-in inquiries) can be added as leads and converted to customers on first order

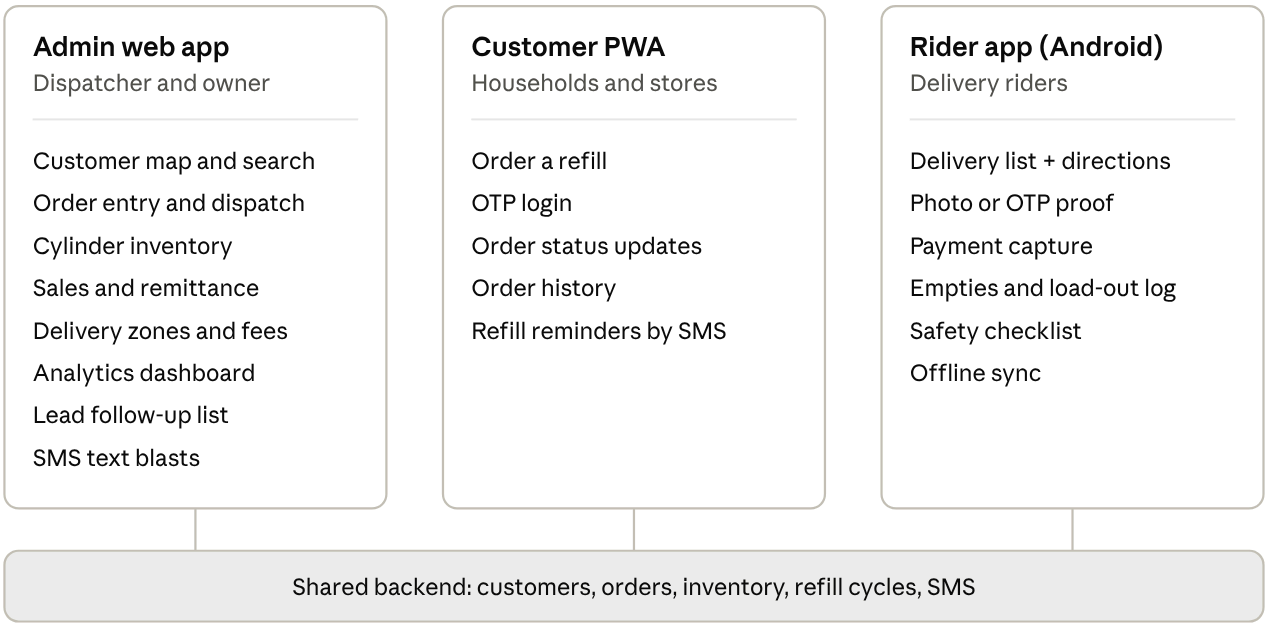

SMS text blast for promos

- Compose a message, pick a segment, preview the recipient count, then send now or schedule
- Segments by town, barangay, cylinder size, last order date, overdue status or order count
- Saved templates for recurring promos
- Delivery report per blast and orders placed within a set window after it
- Only customers who consented to promotional messages are included, in line with the Data Privacy Act

Baseline scope

The baseline is one fixed-price package. It covers what the distributor asked for plus the basics a business with no system yet needs to run on it: customer records, ordering and delivery, cylinder inventory, sales and remittance reports, analytics, refill reminders, lead follow-up and SMS text blasts. Anything outside it is quoted separately as an add-on, so the baseline price stays fixed.

The baseline covers the office, the customer and the rider

baseline scope · 3 apps on 1 backend

Offline sync, a rider safety checklist, delivery zones and inventory are in the baseline because daily operations depend on them. Other recommended features are optional add-ons, priced in the pricing section.

Out of scope for this proposal

- Integration with Petron's internal systems, unless an API or data feed is provided
- Accounting, BIR invoicing and payroll
- Hardware (phones for riders, printers)
- Multi-warehouse management and supplier purchase orders (basic cylinder inventory is included)

Platform recommendation: web app, PWA and native rider app

We recommend a combination, not a single app: a web app for the office, a PWA for customers, and a native Android app for riders, all running on one shared backend. Each user gets the format that fits how and where they work.

User	Platform	Why this format
Dispatcher, owner	Web app (browser on laptop or desktop)	Map, tables and analytics need a large screen; no install, easy updates
Customer	PWA (opens from a link, can be added to the home screen)	No app store download, which is the biggest barrier for occasional buyers; works from SMS and Messenger links
Rider	Native Android app (React Native)	Reliable camera, background GPS and offline storage for proof of delivery in low-signal areas

Why not native apps for everyone from day one? A household orders LPG roughly once a month, and few will download an app for that. A PWA reached from a reminder SMS gets orders without that friction. Native iOS and Android customer apps are available as an add-on if order volume shows customers would use them.

Why not a PWA for riders? Riders depend on the app all day. Browser apps can lose background GPS and offline data more easily, especially on budget Android phones. Riders' phones are company-controlled, so an Android-only app keeps cost down with no iOS build needed.

Proposed tech approach

We propose a web-first build on a managed cloud stack, so the distributor pays for usage rather than servers and the MVP can launch without app store approval. Final choices will be confirmed after discovery.

Component	Proposed option	Why
Admin dashboard	Next.js web app	One codebase for dispatcher and owner views, works on any laptop
Customer ordering	Mobile web app (PWA); native app available as an add-on	No install needed, shareable by link and QR code
Rider app	React Native (Expo), Android only	Camera, GPS and offline capture for proof of delivery

Component	Proposed option	Why
Database and auth	PostgreSQL with PostGIS (e.g. Supabase)	Location queries for the map, nearest rider and barangay views
Maps	Google Maps Platform or Mapbox	Pins, directions, geocoding
Town and barangay list	PSA PSGC codes for Pangasinan	Consistent, official location names for search and filters
SMS	Local SMS gateway (e.g. Semaphore, M360)	Reminders, OTP, text blasts with a registered sender name
Payments	Payment gateway (e.g. PayMongo, Xendit) for GCash and Maya	Online prepayment (add-on)
Hosting	Vercel and managed database	Low maintenance, scales with order volume

Pricing

The baseline is indicatively PHP 441,000 to 661,500 as a fixed price, based on about 147 man-days of freelance work. Add-ons are quoted separately at the same rate, and running costs (SMS, maps, hosting) are paid directly by the distributor.

Rate basis. PHP 3,000 to 4,500 per man-day, a freelance rate. With a two- to three-person team, the baseline takes roughly 3 to 4 months including client reviews and UAT.

Baseline effort breakdown

Module	Man-days
Rider app (Android): delivery list, directions, proof of delivery, payment capture, safety checklist, offline sync	20
Inventory: cylinder stock by size, stock-in, rider load-out and returns, customer deposits, low-stock alerts	15
Discovery and UI/UX design	12
Customer directory, map, search and data import	12

Module	Man-days
Order management and dispatch	12
Customer ordering PWA with OTP login	12
Testing and bug fixing	12
Analytics dashboard: delivery speed, refill cycle, sales	10
Backend setup, user roles, Pangasinan town and barangay data	8
SMS text blast with customer segments	8
Refill-cycle engine and automatic reminders	6
Lead follow-up list and call logging	6
Deployment, UAT and staff training	6
Payment logging, daily sales and rider remittance report	5
Delivery zones and fees	3
Total	**147**

Payment schedule

Milestone	Share	Due when
Downpayment	30%	Contract signing, before discovery starts
Development milestone	40%	Working web app, PWA and rider app delivered for UAT
Go-live	30%	Launch and staff training complete

The baseline includes 30 days of bug fixes after go-live. Changes outside the baseline are quoted as add-ons and agreed before work starts.

Optional add-ons

Add-on	What it does	Man-days	Price (PHP)
Customer feedback	One-tap rating by SMS link after each delivery	3	9,000 to 13,500
Weather and typhoon mode	Pause deliveries by area; send stock-up advisories before storms	3	9,000 to 13,500
SMS keyword ordering	Customer replies REFILL to a reminder to place an order	4	12,000 to 18,000
Scheduled auto-refill	Automatic orders based on each customer's refill cycle	5	15,000 to 22,500
Online prepayment	GCash and Maya payments through a payment gateway	6	18,000 to 27,000
Live rider tracking and ETA	Customer sees the rider on a map with arrival time	8	24,000 to 36,000
Multi-branch support	Separate branches, riders, stock and reports under one account	10	30,000 to 45,000
Loyalty and referrals	Rewards for repeat orders and referred customers	10	30,000 to 45,000
Messenger ordering bot	Orders through the distributor's Facebook page	12	36,000 to 54,000
Route optimization	Best delivery order for each rider's list	12	36,000 to 54,000
Reseller and store portal	Bulk orders and balances for sari-sari stores and sub-dealers	15	45,000 to 67,500
Native customer app	iOS and Android app store versions of the customer PWA	18	54,000 to 81,000

Running costs paid by the distributor (not included above)

Item	Indicative cost	Notes
SMS	PHP 0.56 per message, ex. VAT (Semaphore)	OTP messages use 2 credits. Example: 1,000 customers with 2 reminders and 2 blasts a month is about 4,000 SMS, or PHP 2,240
Maps	Free up to 10,000 calls per product per month (Google Maps Platform)	Expected to stay within the free tier at launch volume; interactive maps cost USD 7 per 1,000 loads beyond it
Hosting and database	Approximately PHP 3,000 to 5,000 per month	Managed hosting and database; grows with usage
App stores	Google Play one-time developer fee; Apple yearly fee only if the native customer app add-on is taken	Rider app is Android only
Support after warranty	Monthly retainer or per-request fixes	Bug fixes, OS updates, minor changes

Assumptions, risks and next steps

Assumptions

- The distributor operates its own rider fleet and sets its own delivery prices
- Riders have Android phones with mobile data
- An existing customer list (spreadsheet, notebook or contacts) can be imported to seed the map

Risks and mitigations

Risk	Mitigation
Customers keep calling instead of using the app	Dispatcher order entry is a full path; reminders link to the order page to build the habit

Risk	Mitigation
Rural addresses are hard to find	Pin drop on first delivery plus landmark notes; pins reused on every order after
SMS costs grow with blasts	Segment targeting, send limits per blast, cost preview before sending
Privacy complaints about promos	Explicit consent at signup, opt-out in every message, consent records kept
Use of Fiesta Gas and Petron branding	Confirm brand guidelines and approval with Petron before launch

Open questions for discovery

- [ ] Which towns are covered today, and is the plan all of Pangasinan?
- [ ] How many riders, branches and active customers are there now?
- [ ] Which cylinder sizes and prices are carried, and how are deposits handled?
- [ ] Are customers mostly households, or also stores and resellers?
- [ ] Which payment methods are accepted today?
- [ ] What format are the current customer list and stock records in (notebook, spreadsheet, none)?
- [ ] Who covers SMS and map usage costs after launch?
- [ ] Is there a budget range and target launch date?

Next steps

1. Discovery session with the owner and dispatcher to answer the open questions
2. Collect a sample of the customer list and recent orders
3. Confirm the baseline scope and any add-ons
4. Sign off the fixed quote and payment schedule
